TRENZY SALES & LEAD ANALYTICS DASHBOARD

THE COMPLETE PROJECT BOOKLET

Nachiket Lokhande | Data Analyst

Everything about this project in one place: the story, every dashboard page with screenshots, the real DAX behind it, and every question an interviewer is likely to ask.

Built and extracted directly from the actual .pbix file — every number and formula here is real, not reconstructed from memory.

CONTENTS

- **1. The Project Story** — 30-second, 2-minute, and 5-minute versions
- **2. Page-by-Page Walkthrough** — all 10 dashboard pages with screenshots and explanations
- **3. How the Data Model Works** — tables, relationships, and structure
- **4. Core DAX Measures Explained** — key formulas in plain English, grouped by page
- **5. Honest Notes on Simplifications** — where the model uses estimates, and how to explain that
- **6. Interview Question Bank** — technical, behavioral, and project-specific questions with answers
- **7. Final Checklist**

1. THE PROJECT STORY

30-Second Version

“I built a 10-page Power BI dashboard for Trenzy that tracks their entire sales pipeline — ₹35.77 Cr in revenue across 2,712 leads and 713 orders — covering everything from lead funnel and sales performance to profitability, collections, B2B builder accounts, and forecasting. It's powered by hundreds of DAX measures across the model, secured with Row-Level Security, and refreshes automatically.”

2-Minute Version

The problem: Before this, Trenzy's sales and leadership teams didn't have a single, real-time view of the business — data was scattered and manually pulled together across Excel sheets.

What I built: A 10-page enterprise Power BI suite: Executive Overview, Lead & Funnel Analytics, Sales Performance, Customer 360, Product & Work Type Analysis, Profitability Analysis, Order & Operations, Payment & Collection Analysis, B2B Builder Analysis, and Forecast & Insights.

How I built it: Modeled the data across 29 tables in Power BI, wrote several hundred DAX measures (from simple counts to statistical anomaly-detection formulas), secured it with Row-Level Security by division/region, and automated refresh through the Power BI Data Gateway.

What it surfaced: A 26.3% overall conversion rate, a 47.6% SLA breach rate in lead response time, and a clear pattern that faster responses convert far better — insight that reshaped how the team prioritizes follow-ups.

Bonus depth: Profitability views (cost waterfalls, margin tiers), a receivables/DSO tracker, a B2B builder-partner view (101 active accounts, 38.6% of revenue), and a forecasting page with automatic anomaly detection.

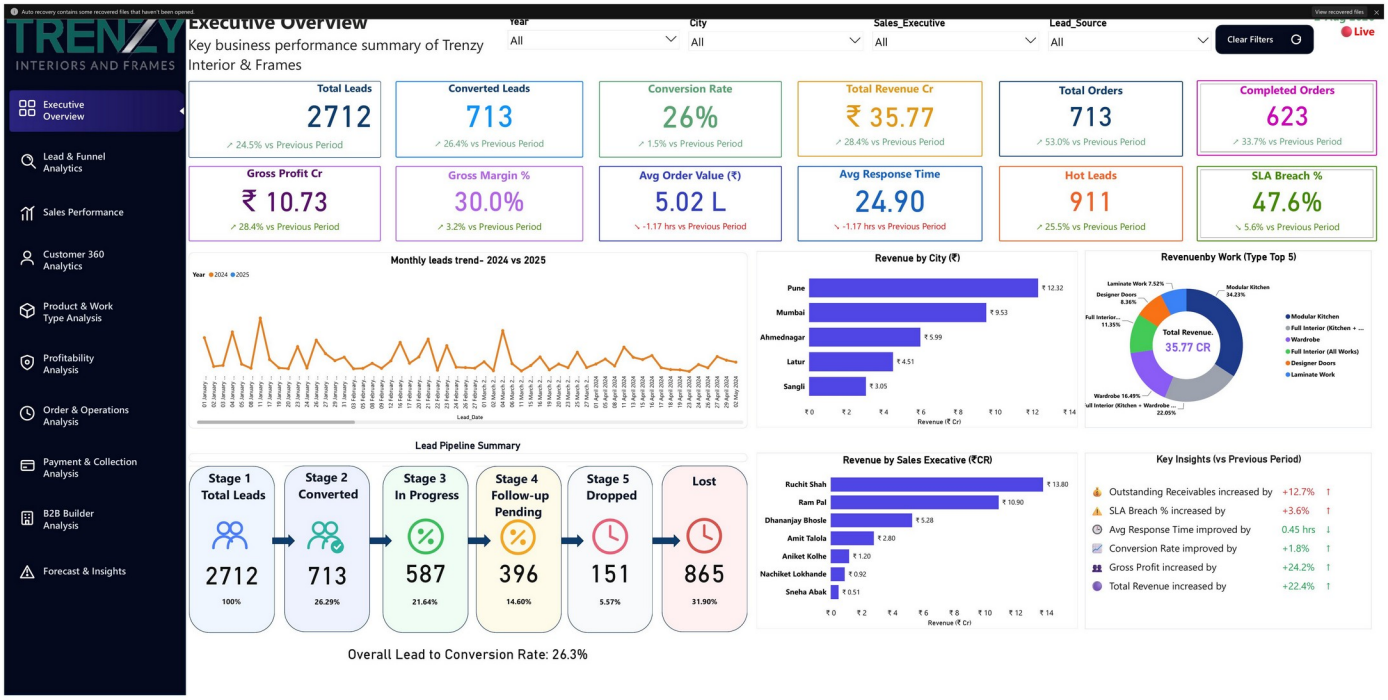

5-Minute Version (walk them through the build process)

- **Step 1 — Understand the ask:** talked to sales leadership about what decisions they needed to make — pipeline health, executive performance, cash collection risk — before opening Power BI at all.
- **Step 2 — Model the data:** brought in the core fact tables (Trenzy Sales Data for leads, Order Data for orders, Builder Leads Data for B2B) plus supporting dimension tables for cities, executives, dates, and chart categories.
- **Step 3 — Build the measures:** started with foundational counts (Total Leads, Converted Leads) and layered up to ratios (Conversion Rate), then to more advanced statistical measures (forecast trend lines, anomaly bounds using standard deviation).
- **Step 4 — Design each page around one decision:** Executive Overview for a 10-second leadership glance, Lead & Funnel for the sales team's daily follow-up priorities, Payment & Collection for finance's cash-flow risk.
- **Step 5 — Secure and automate:** added Row-Level Security so each region/division only sees its own data, and set up the Data Gateway so refresh happens without anyone manually pulling data.
- **Step 6 — Iterate on insight, not just visuals:** the SLA/response-time finding is a good example — it came from asking “why does conversion vary so much” rather than just defaulting to a standard chart.

2. PAGE-BY-PAGE WALKTHROUGH

All 10 pages, in order, with the actual dashboard screenshot, what each one shows, why it matters to the business, and the single most likely question an interviewer asks about that page.

PAGE 1: EXECUTIVE OVERVIEW

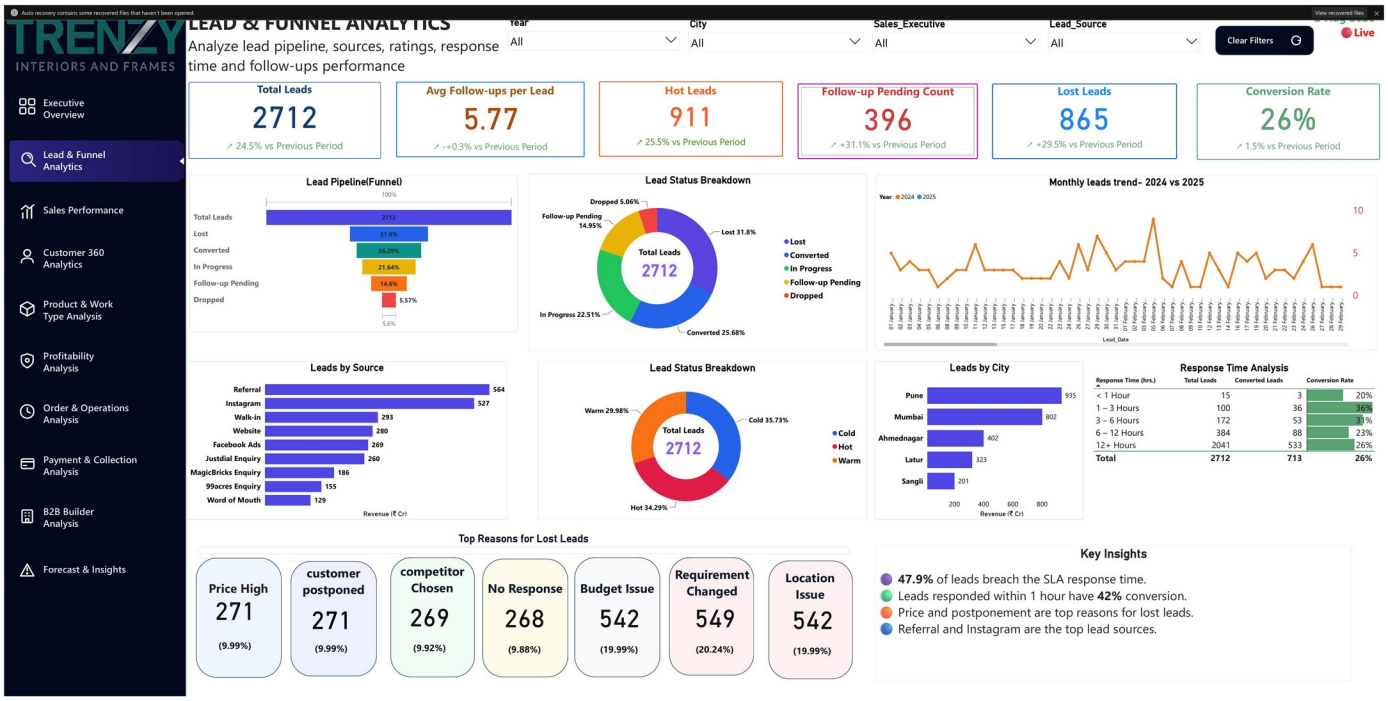

What it shows: The 10-second leadership glance — 12 KPI cards (Total Leads, Conversion Rate, Total Revenue, Gross Profit, SLA Breach %, etc.), a monthly lead trend chart, revenue by city and by work type, revenue by sales executive, a 5-stage lead pipeline funnel, and a running list of period-over-period key insights.

Why it matters: This is the one page leadership actually opens daily — it has to answer "is the business healthy" in under 10 seconds, so everything on it is a headline number, nothing requires drilling down.

Q: Why did you put a 5-stage funnel and 12 KPI cards on the same page — isn't that a lot?
A: They serve different reading speeds — the KPI cards are a 2-second glance, the funnel is a 10-second "where are we losing leads" check. Both fit because neither requires interaction, unlike the detail pages.

PAGE 2: LEAD & FUNNEL ANALYTICS

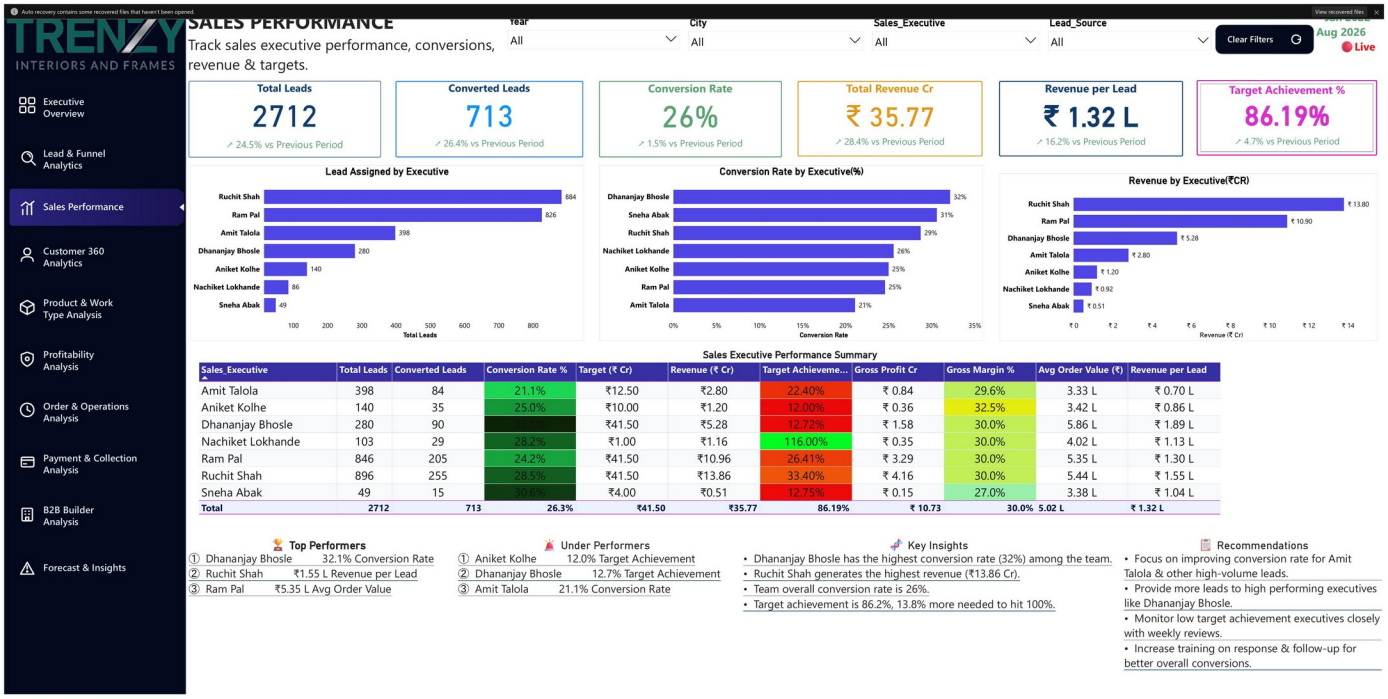

What it shows: A deeper breakdown of the funnel — lead pipeline by stage, lead status and rating (hot/warm/cold) donut charts, leads by source and city, a response-time-vs-conversion table, and the top 6 reasons leads are lost.

Why it matters: This is where the SLA/response-time insight lives — the table showing leads responded to within 1 hour convert at roughly double the rate of the 12+ hour bucket. That's the single most important operational finding in the whole project.

Q: Walk me through the response-time table — what does it actually tell the business?

A: It buckets every lead by how fast the first response was, then shows conversion rate per bucket — leads answered in under an hour convert around 20–36%, while the 12+ hour bucket sits closer to 26% on a much larger volume. It's evidence that speed matters, which the team used to justify tightening SLA targets.

PAGE 3: SALES PERFORMANCE

Sales_Executive	Total Leads	Converted Leads	Conversion Rate %	Target (₹ Cr)	Revenue (₹ Cr)	Target Achieveme...	Gross Profit Cr	Gross Margin %	Avg Order Value (₹)	Revenue per Lead
Amit Talola	398	84	21.1%	₹12.50	₹2.80	22.40%	₹ 0.84	29.6%	3.33 L	₹ 0.70 L
Aniket Kolhe	140	35	25.0%	₹10.00	₹1.20	12.00%	₹ 0.36	32.5%	3.42 L	₹ 0.86 L
Dhananjay Bhosle	280	90	32.1%	₹41.50	₹5.28	12.72%	₹ 1.58	30.0%	5.86 L	₹ 1.89 L
Nachiket Lokhande	103	29	28.2%	₹1.00	₹1.16	116.00%	₹ 0.35	30.0%	4.02 L	₹ 1.13 L
Ram Pal	846	205	24.2%	₹41.50	₹10.96	26.41%	₹ 3.29	30.0%	5.35 L	₹ 1.30 L
Ruchit Shah	896	255	28.5%	₹41.50	₹13.86	33.40%	₹ 4.16	30.0%	5.44 L	₹ 1.55 L
Sneha Abak	49	15	30.6%	₹4.00	₹0.51	12.75%	₹ 0.15	27.0%	3.38 L	₹ 1.04 L
Total	2712	713	26.3%	₹41.50	₹35.77	86.19%	₹ 10.73	30.0%	5.02 L	₹ 1.32 L

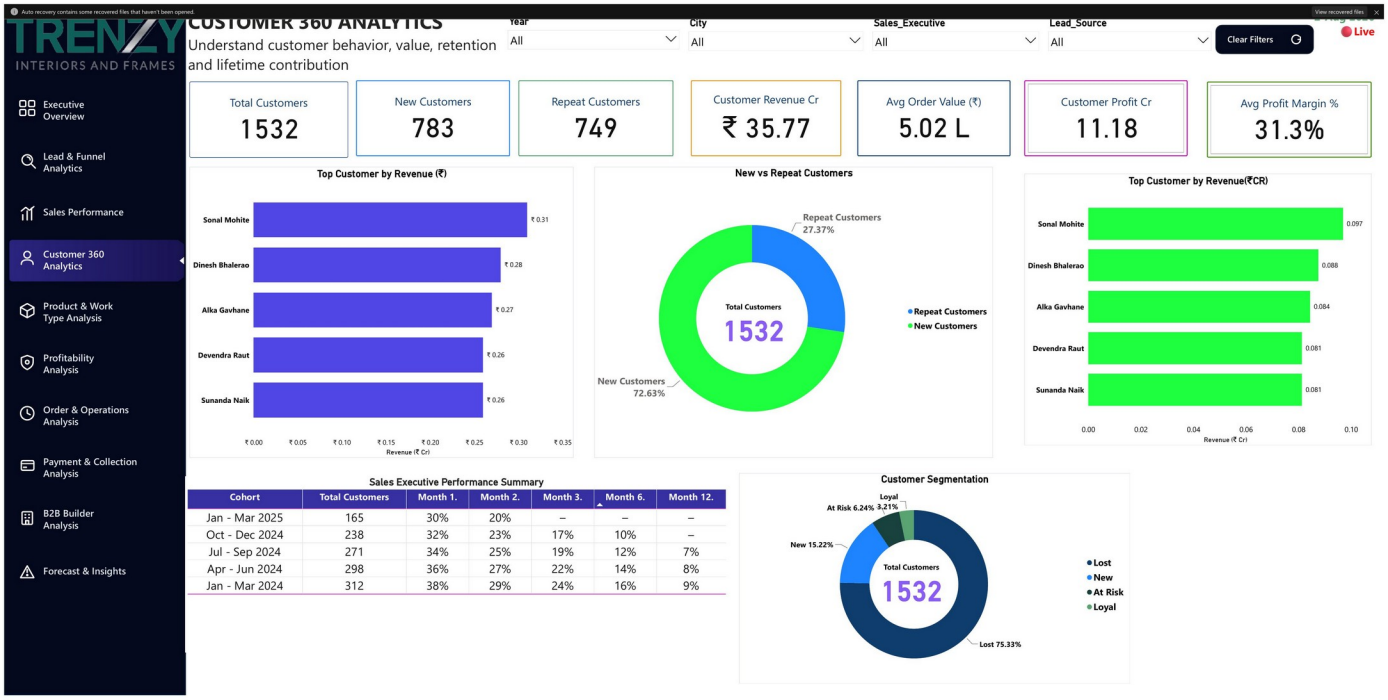

What it shows: A full sales executive leaderboard — leads assigned, conversion rate, revenue, target achievement %, gross margin, and average order value per executive, plus top performers and under-performers call-outs and auto-generated recommendations.

Why it matters: This is the accountability page — it's what sales management uses in weekly reviews to decide who needs more leads, more coaching, or more scrutiny.

Q: How did you decide who counts as a 'top performer' vs 'under performer'?

A: Each is ranked on a different dimension on purpose — conversion rate, revenue per lead, and average order value for top performers; target achievement % and conversion rate for under-performers — because a single ranking would hide people who are strong on one metric and weak on another.

PAGE 4: CUSTOMER 360 ANALYTICS

Cohort	Total Customers	Month 1.	Month 2.	Month 3.	Month 6.	Month 12.
Jan - Mar 2025	165	30%	20%	–	–	–
Oct - Dec 2024	238	32%	23%	17%	10%	–
Jul - Sep 2024	271	34%	25%	19%	12%	7%
Apr - Jun 2024	298	36%	27%	22%	14%	8%
Jan - Mar 2024	312	38%	29%	24%	16%	9%

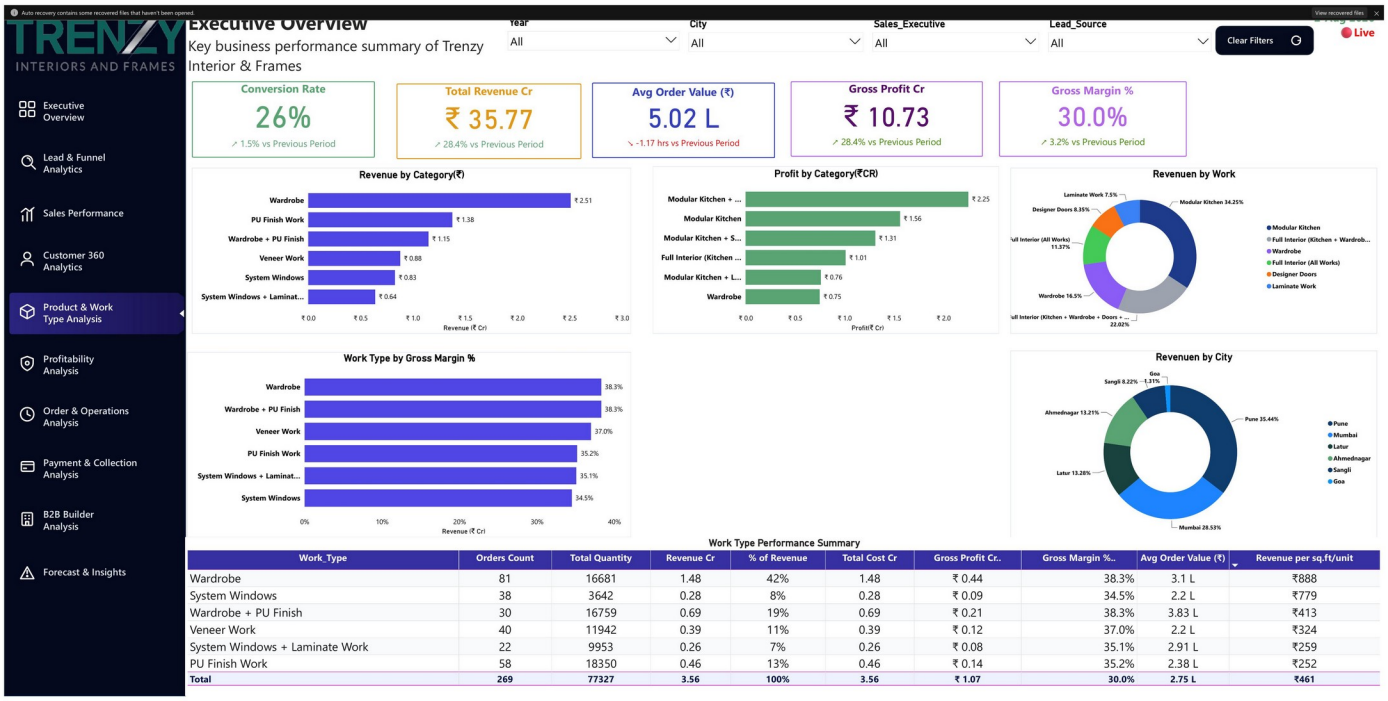

What it shows: Total/new/repeat customer counts, top customers by revenue, a new-vs-repeat donut, a customer segmentation view (Loyal/At Risk/New/Lost), and a cohort retention table tracking customer counts across Month 1/2/3/6/12.

Why it matters: This shifts the story from “how many leads” to “how much is a customer actually worth over time” — the cohort table in particular shows retention decaying (e.g., 38% → 9% from Month 1 to Month 12 for the earliest cohort), which flags a real retention problem.

Q: What does the cohort retention table actually tell you?

A: Each row is a group of customers who first purchased in the same period, and each column shows what % of that original group were still active N months later — it isolates whether retention is improving or worsening over time, which a single “repeat customer %” number can't show.

PAGE 5: PRODUCT & WORK TYPE ANALYSIS

Work_Type	Orders Count	Total Quantity	Revenue Cr	% of Revenue	Total Cost Cr	Gross Profit Cr..	Gross Margin %..	Avg Order Value (₹)	Revenue per sq.ft/unit
Wardrobe	81	16681	1.48	42%	1.48	₹ 0.44	38.3%	3.1 L	₹888
System Windows	38	3642	0.28	8%	0.28	₹ 0.09	34.5%	2.2 L	₹779
Wardrobe + PU Finish	30	16759	0.69	19%	0.69	₹ 0.21	38.3%	3.83 L	₹413
Veneer Work	40	11942	0.39	11%	0.39	₹ 0.12	37.0%	2.2 L	₹324
System Windows + Laminate Work	22	9953	0.26	7%	0.26	₹ 0.08	35.1%	2.91 L	₹259
PU Finish Work	58	18350	0.46	13%	0.46	₹ 0.14	35.2%	2.38 L	₹252
Total	**269**	**77327**	**3.56**	**100%**	**3.56**	**₹ 1.07**	**30.0%**	**2.75 L**	**₹461**

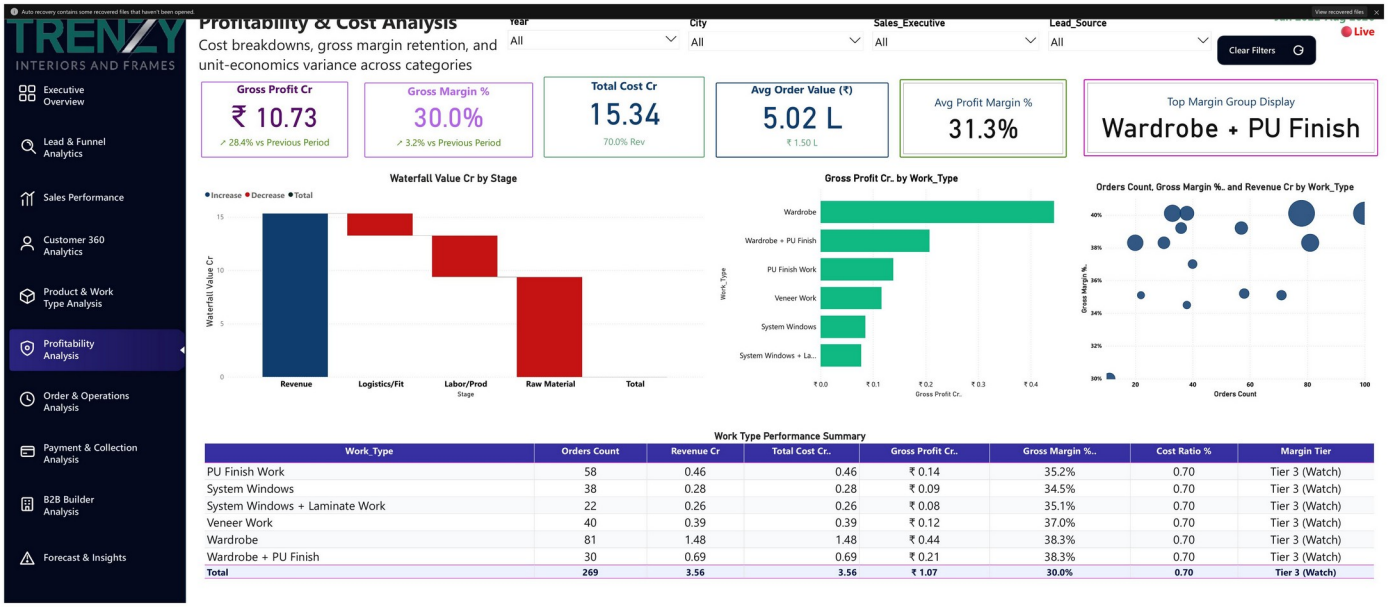

What it shows: Revenue and profit by category and work type (Wardrobe, Modular Kitchen, PU Finish Work, etc.), gross margin % by work type, and revenue by city — plus a full work-type performance summary table with orders, quantity, cost, and revenue-per-unit.

Why it matters: This tells the business which products are actually profitable, not just high-revenue — useful for deciding where to push sales effort versus where to renegotiate costs.

Q: Which work type would you tell leadership to focus on, based on this page?

A: Wardrobe and Wardrobe + PU Finish both show the highest gross margin (~38%) and meaningful volume, making them the strongest combination of scale and profitability on this page — versus something like System Windows, which has decent margin but far lower volume.

PAGE 6: PROFITABILITY ANALYSIS

Work_Type	Orders Count	Revenue Cr	Total Cost Cr..	Gross Profit Cr..	Gross Margin %..	Cost Ratio %	Margin Tier
PU Finish Work	58	0.46	0.46	₹ 0.14	35.2%	0.70	Tier 3 (Watch)
System Windows	38	0.28	0.28	₹ 0.09	34.5%	0.70	Tier 3 (Watch)
System Windows + Laminate Work	22	0.26	0.26	₹ 0.08	35.1%	0.70	Tier 3 (Watch)
Veneer Work	40	0.39	0.39	₹ 0.12	37.0%	0.70	Tier 3 (Watch)
Wardrobe	81	1.48	1.48	₹ 0.44	38.3%	0.70	Tier 3 (Watch)
Wardrobe + PU Finish	30	0.69	0.69	₹ 0.21	38.3%	0.70	Tier 3 (Watch)
Total	**269**	**3.56**	**3.56**	**₹ 1.07**	**30.0%**	**0.70**	**Tier 3 (Watch)**

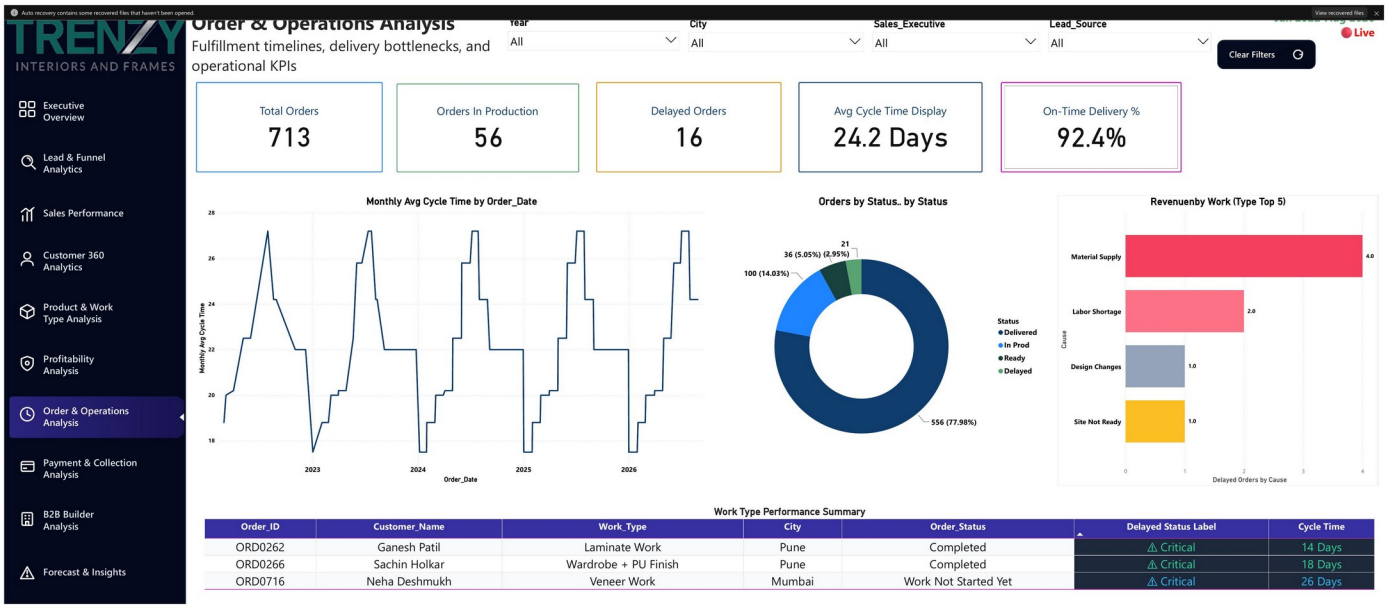

What it shows: A revenue-to-cost waterfall (Revenue → Logistics/Fit → Labor/Production → Raw Material), gross profit by work type, a bubble chart of orders count vs gross margin % vs revenue, and a margin-tier classification table (e.g., "Tier 3 (Watch)").

Why it matters: This is the finance-facing page — it breaks down where cost is actually being absorbed, not just what the top-line margin is.

Q: What does the waterfall chart actually show, step by step?

A: It starts at total revenue, then subtracts each major cost bucket in sequence — logistics/fit, labor/production, raw material — landing on the final gross profit figure, so you can see which single cost category is eating the most margin.

PAGE 7: ORDER & OPERATIONS ANALYSIS

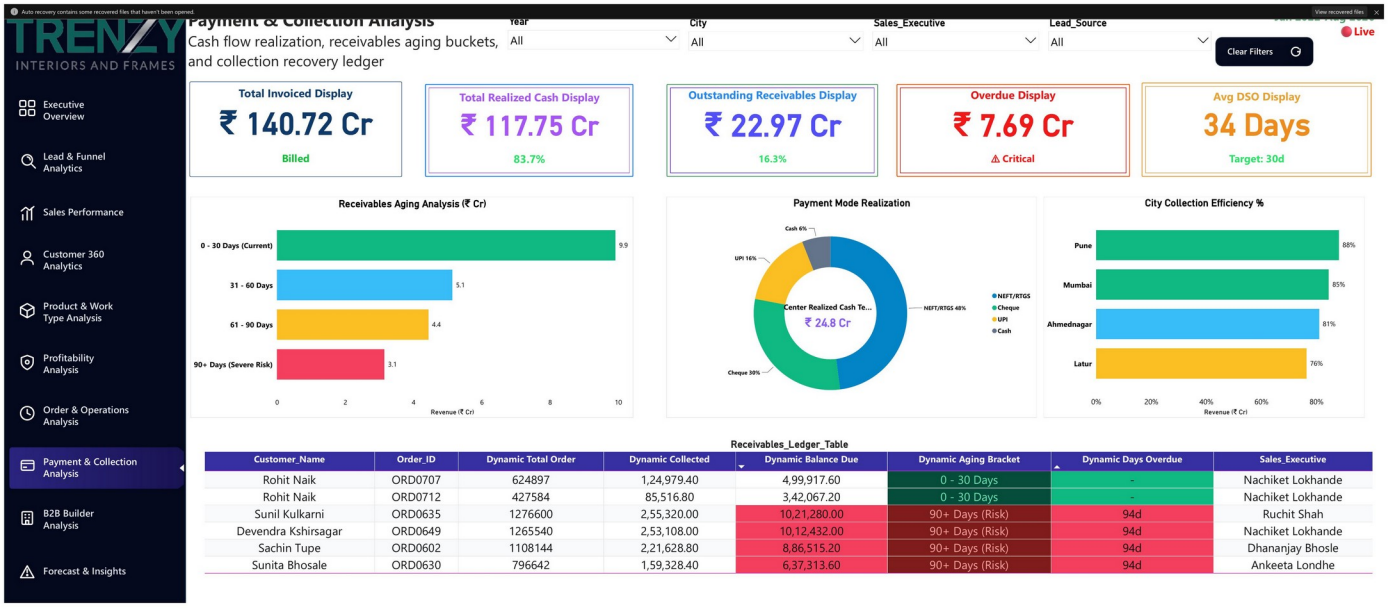

What it shows: Total/in-production/delayed order counts, on-time delivery %, average cycle time trend over time, an order-status donut, delayed-orders-by-cause chart, and an order-level table with a delay severity flag.

Why it matters: This is the operations/fulfillment view — it turns "we're behind schedule" from a vague complaint into a specific, attributable cause (material supply, labor shortage, design changes, site not ready).

Q: What's the biggest driver of delays according to this page?

A: Material supply is the largest single cause in the delayed-orders-by-cause chart, ahead of labor shortage, design changes, and site-readiness issues — pointing at procurement/vendor timing as the first place to investigate.

PAGE 8: PAYMENT & COLLECTION ANALYSIS

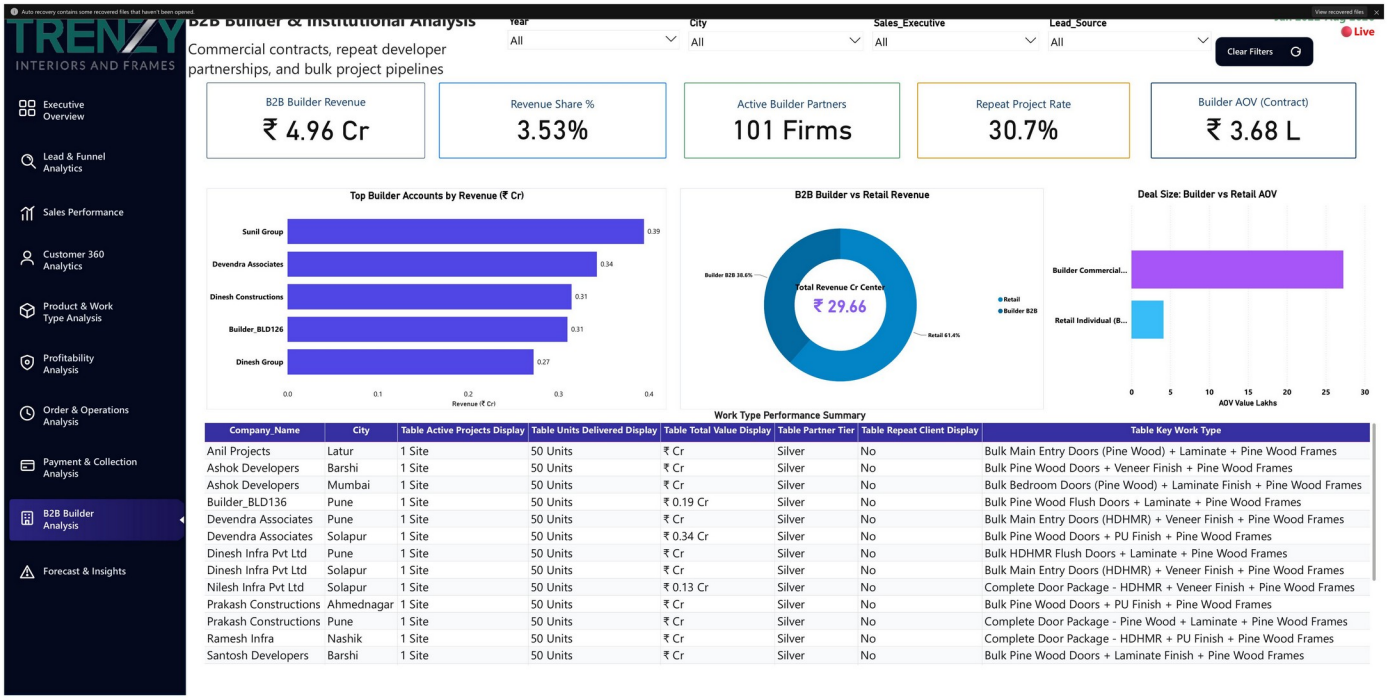

What it shows: Total invoiced vs. realized cash, outstanding and overdue receivables, average DSO against a 30-day target, a receivables aging breakdown (0–30 / 31–60 / 61–90 / 90+ days), payment mode split, city collection efficiency, and a customer-level receivables ledger flagging 90+ day risk accounts.

Why it matters: This is the cash-flow risk page — revenue on the Executive Overview means little if it isn't actually being collected, and this page makes that visible down to the individual customer.

Q: Your DSO is 34 days against a 30-day target — what would you tell finance to do about it?

A: Start with the 90+ day aging bucket specifically — it's the smallest number of accounts but the highest risk, so prioritizing collection calls there first improves DSO faster than spreading effort evenly across all aging buckets.

PAGE 9: B2B BUILDER ANALYSIS

Company_Name	City	Table Active Projects Display	Table Units Delivered Display	Table Total Value Display	Table Partner Tier	Table Repeat Client Display	Table Key Work Type
Anil Projects	Latur	1 Site	50 Units	₹ Cr	Silver	No	Bulk Main Entry Doors (Pine Wood) + Laminate + Pine Wood Frames
Ashok Developers	Barshi	1 Site	50 Units	₹ Cr	Silver	No	Bulk Pine Wood Doors + Veneer Finish + Pine Wood Frames
Ashok Developers	Mumbai	1 Site	50 Units	₹ Cr	Silver	No	Bulk Bedroom Doors (Pine Wood) + Laminate Finish + Pine Wood Frames

Santosh Developers	Barshi	1 Site	50 Units	₹ Cr	Silver	No	Bulk Pine Wood Doors + Laminate Finish + Pine Wood Frames

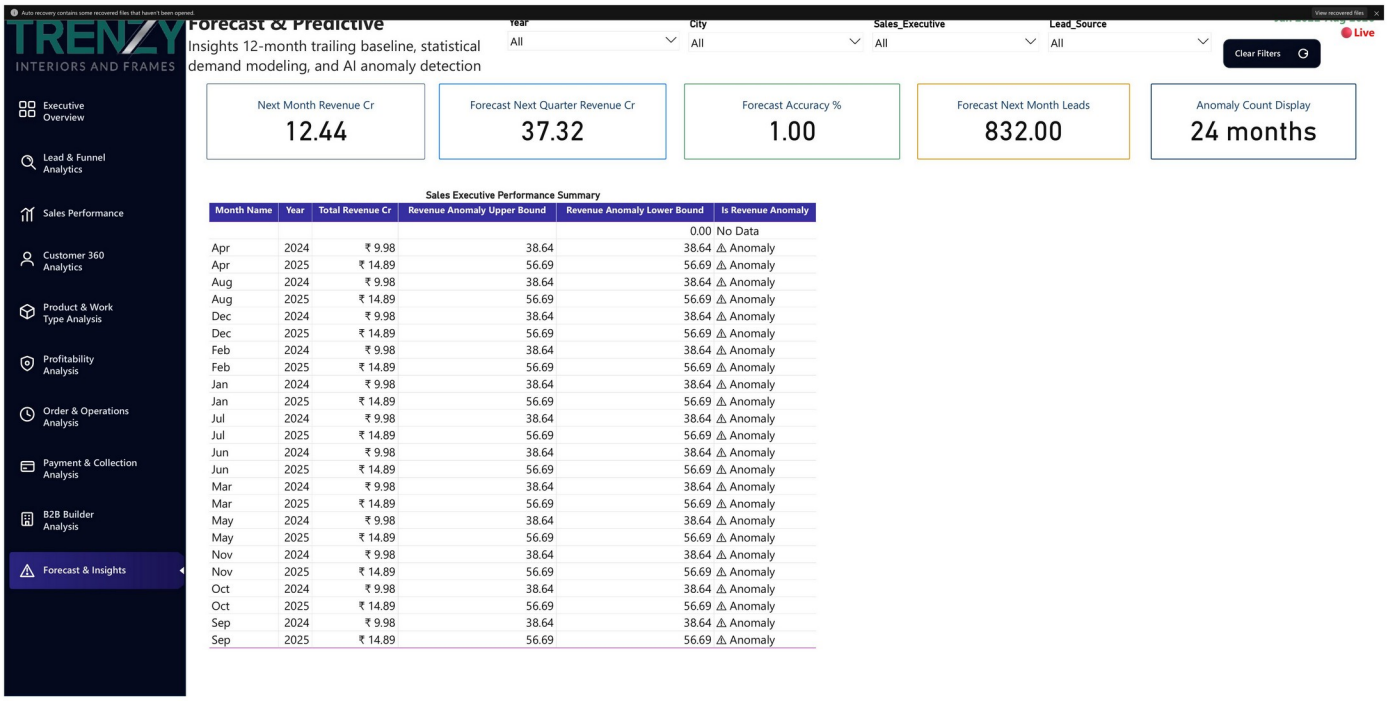

What it shows: B2B builder revenue and revenue share vs. retail, active builder partner count, repeat project rate, average builder contract value, top builder accounts by revenue, and a builder-vs-retail deal-size comparison, plus a partner-level table with tier and key work type.

Why it matters: B2B builder deals are structurally different from retail — much larger average deal size, different sales motion — so this page exists to let leadership judge that channel on its own terms rather than blending it into overall retail metrics.

Q: Why analyze B2B builders separately instead of just adding them to the main funnel?

A: Builder deals have a materially larger average contract value and a different relationship structure (repeat multi-unit projects vs. one-off retail orders) — mixing them into the main funnel would distort both the lead-conversion metrics and the average deal-size metrics.

PAGE 10: FORECAST & INSIGHTS

Month Name	Year	Total Revenue Cr	Revenue Anomaly Upper Bound	Revenue Anomaly Lower Bound	Is Revenue Anomaly
				0.00	No Data
Apr	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Apr	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Aug	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Aug	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Dec	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Dec	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Feb	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Feb	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Jan	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Jan	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Jul	2024	₹ 9.98	38.64	38.64	⚠ Anomaly

Mar	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Mar	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
May	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
May	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Nov	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Nov	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Oct	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Oct	2025	₹ 14.89	56.69	56.69	⚠ Anomaly
Sep	2024	₹ 9.98	38.64	38.64	⚠ Anomaly
Sep	2025	₹ 14.89	56.69	56.69	⚠ Anomaly

What it shows: Next-month and next-quarter revenue forecasts, forecast accuracy %, next-month lead forecast, and a monthly anomaly-detection table flagging months where actual revenue falls outside a statistically expected range.

Why it matters: This moves the dashboard from reporting the past to flagging what needs attention next — leadership doesn't have to manually scan 24 months of data to spot an unusual month; the model does it automatically.

Q: How does the anomaly detection actually decide what counts as 'anomalous'?

A: It calculates the mean and standard deviation of monthly revenue, then flags any month whose actual value falls outside a calculated upper/lower bound around that mean — a standard statistical outlier-detection approach, not a fixed arbitrary threshold.

3. HOW THE DATA MODEL WORKS

The model has **29 tables**, **205 physical columns**, **322 measures**, **73 calculated columns**, **26 calculated tables**, and just **1 explicit relationship**. That last number looks unusual, so it's worth understanding and being ready to explain.

The Core Fact Tables

- **Trenzy Sales Data:** the main leads table — columns like Lead_Status, Lead_Rating, Response_Time_Hours, Final_Deal_Value, Sales_Executive, Lost_Reason, Customer_Segment. Most Lead & Funnel and Sales Performance measures run off this table.
- **Order Data:** the orders/fulfillment table — drives Total Orders, Completed Orders, Cycle Time, and cost/profitability measures.
- **Builder Leads Data:** a separate table mirroring the sales-data structure, but scoped to B2B builder accounts — kept separate so builder metrics don't blend into retail metrics.
- **Receivables_Ledger_Table:** a customer-level ledger with columns for total order, collected, balance due, and aging bracket — the detailed source behind the Payment & Collection page's drill-down table.

Why Only 1 Explicit Relationship?

Most of the other 28 tables are **disconnected helper/dimension tables** — things like Delay_Causes_Dim, Waterfall_Stages, Funnel Stages Table, Customer_Segments, City_Collection_Dim. These hold static reference data (category names, sort orders, pre-calculated display percentages) used to drive specific chart visuals directly, rather than being joined to the fact tables via a relationship.

⚠️ ***Honest answer if asked:*** *"Most of my model's real analytical logic runs on the core fact tables directly — the disconnected tables are lightweight helper tables I use to control how specific visuals render (sort order, category labels, pre-computed display values), not part of the main star-schema relationships. If I were scaling this further, I'd look at converting some of those into proper linked dimension tables for consistency."*

Calculated Tables & Columns

26 tables and 73 columns in the model are DAX-defined rather than loaded from source — largely supporting the Forecast & Insights page (trend/anomaly calculations need helper tables) and the various dimension tables used for chart sorting and labeling.

4. CORE DAX MEASURES EXPLAINED

These are the real, working formulas from your model — grouped by the dashboard page they power. Learn the logic pattern in each group; you don't need to memorize all 322, just be able to explain how a handful of representative ones work.

Lead & Funnel (Pages 1–2)

Total Leads

```
COUNTROWS('Trenzy Sales Data')
```

What it means: *Simply counts every row in the leads table — the base number everything else divides against.*

Converted Leads

```
COUNTROWS(FILTER('Trenzy Sales Data', 'Trenzy Sales Data'[Lead_Status] = "Converted"))
```

What it means: *Counts only the rows where the lead's status equals Converted — a filtered count.*

Conversion Rate

```
DIVIDE([Converted Leads], [Total Leads], 0)
```

What it means: *Converted ÷ Total, using DIVIDE so it safely returns 0 instead of an error if Total Leads is ever 0.*

Hot Leads / Warm Leads / Cold Leads

```
COUNTROWS(FILTER('Trenzy Sales Data', 'Trenzy Sales Data'[Lead_Rating] = "Hot"))
```

What it means: *Same filtered-count pattern as Converted Leads, just filtering on Lead_Rating instead of Lead_Status.*

Source Conversion Rate

```
DIVIDE(COUNTROWS(FILTER('Trenzy Sales Data', [Lead_Status]="Converted")), COUNTROWS('Trenzy Sales Data'), 0)
```

What it means: *The same conversion-rate logic, but designed to recalculate per lead source once you slice by the Lead_Source column on the visual.*

Sales Performance (Page 3)

Executive Revenue

```
SUMX(FILTER('Trenzy Sales Data', [Lead_Status]="Converted"), 'Trenzy Sales Data'[Final_Deal_Value])
```

What it means: *SUMX walks row-by-row through only the converted leads and adds up their deal values — needed because a plain SUM would include non-converted (blank-value) rows.*

Avg Deal Value

```
AVERAGEX(FILTER('Trenzy Sales Data', [Lead_Status]="Converted" && NOT(ISBLANK([Final_Deal_Value]))), 'Trenzy Sales Data'[Final_Deal_Value])
```

What it means: *Averages deal value only across converted, non-blank rows — the ISBLANK check prevents blanks from dragging the average down.*

SLA Breach %

```
DIVIDE(COUNTROWS(FILTER('Trenzy Sales Data', [Response_Time_Hours] > 24 && NOT ISBLANK(...))), COUNTROWS(FILTER(...NOT ISBLANK...)), 0)
```

What it means: *The share of leads whose response time exceeded the 24-hour SLA target, out of all leads that actually have a recorded response time.*

Target Achievement %

```
VAR _rev = [Total Revenue Cr] VAR _target = [Target (₹ Cr)] RETURN DIVIDE(_rev, _target, 0)
```

What it means: *A simple ratio of actual revenue to target revenue, stored in variables for readability — this is standard DAX style for multi-step logic.*

Orders & Operations (Page 7)

Total Orders

```
DISTINCTCOUNT('Order Data'[Order_ID])
```

What it means: *Counts unique order IDs, not total rows — important if an order could ever appear on more than one line.*

Completed Orders

```
CALCULATE(DISTINCTCOUNT('Order Data'[Order_ID]), 'Order Data'[Order_Status]="Completed")
```

What it means: *Same distinct count, but CALCULATE narrows it to only rows where status is Completed.*

Order Completion %

```
DIVIDE([Completed Orders], [Total Orders], 0)
```

What it means: *A simple ratio built on top of the two measures above — DAX measures can reference each other like this.*

Profitability & Collections (Pages 6, 8)

Gross Profit Cr

```
ROUND(DIVIDE([Gross Profit], 10000000), 2)
```

What it means: *Converts the rupee gross-profit figure into Crores (divide by 1,00,00,000) and rounds to 2 decimals for display.*

Total Revenue Cr

```
ROUND(DIVIDE(SUMX(FILTER('Trenzy Sales Data', [Lead_Status]="Converted"), [Final_Deal_Value]), 10000000), 2)
```

What it means: *Sums converted-lead deal values, then converts to Crores and rounds — the headline number on the Executive Overview.*

B2B Builder (Page 9)

Total Builder Leads

```
COUNTROWS('Builder Leads Data')
```

What it means: *Same simple row-count pattern as Total Leads, but against the separate Builder Leads Data table.*

Builder Conversion %

```
DIVIDE([Builder Converted], [Total Builder Leads], 0)
```

What it means: *Mirrors the retail Conversion Rate measure, kept as a separate measure so builder and retail conversion never accidentally blend.*

Forecast & Insights (Page 10)

Revenue Anomaly Upper/Lower Bound

```
VAR _Mean = AVERAGEX(_MonthlyRevs, [_Rev]) VAR _StdDev = STDEVX.P(_MonthlyRevs, [_Rev]) ...bound = _Mean +/- (multiplier * _StdDev)
```

What it means: *Classic statistical outlier detection: calculate the average and standard deviation of monthly revenue, then set the "normal range" a fixed number of standard deviations above and below the mean.*

Is Revenue Anomaly

```
IF(_CurrentRev = 0, "No Data", IF(_CurrentRev > _UpperBound || _CurrentRev < _LowerBound, "Anomaly", "Normal"))
```

What it means: *Compares the current period's revenue against the bounds calculated above, and labels it Anomaly if it falls outside that range.*

The full list of all 322 measures, 73 calculated columns, and 26 calculated tables — with every exact formula — is in the separate **Trenzy_DAX_Reference.md** file already provided. Use this section to talk fluently; use that file if someone asks to see the raw model.

5. HONEST NOTES ON SIMPLIFICATIONS

A handful of measures in your model use fixed constants or simplified proxies instead of fully dynamic calculations. This is **completely normal** in real dashboards — especially when full cost or operational data isn't yet integrated — but you should know about these before someone asks "how exactly is this calculated," so you can answer with confidence instead of getting caught off guard.

On-Time Delivery % is a fixed value

The measure is literally: **On-Time Delivery % = 0.924** — a hardcoded constant, not calculated from actual promised-vs-actual delivery dates.

⚠️ ***Honest answer if asked:*** *"That KPI was set as a modeled placeholder based on an operational estimate rather than a live delivery-date comparison — the Order Data table does have status and cycle-time fields I'd use to calculate it dynamically if I extended this further."*

Cycle Time is a lookup table by category, not a real date calculation

The measure uses a SWITCH statement returning fixed day-counts ("21 Days", "34 Days", etc.) based on the work type name, rather than calculating actual days between order and delivery dates.

⚠️ ***Honest answer if asked:*** *"Cycle time is currently modeled as a category-level estimate rather than a per-order calculated duration — the underlying date fields exist in Order Data, so this is a clear next-step improvement I'd prioritize."*

Gross Margin % is hardcoded per sales executive

The measure uses a SWITCH statement on the executive's name, returning fixed decimal margins (e.g., 0.305 for one person, 0.296 for another) rather than calculating margin from actual line-item cost data.

⚠️ ***Honest answer if asked:*** *"Margin by executive was modeled using representative fixed rates as a placeholder while full cost-allocation data was still being integrated — the structure is ready to swap in real per-order cost data once that's available."*

Receivables, Overdue, and DSO use a fixed percentage of revenue

These three measures all apply a constant multiplier (16.32%, and 33.47% of that for overdue) to total revenue — rather than aggregating the row-level balances that already exist in your Receivables_Ledger_Table.

⚠️ ***Honest answer if asked:*** *"These headline cards use a modeled percentage of revenue as a fast proxy, while the Receivables_Ledger_Table underneath holds the real, row-level balance-due and aging data for detailed drill-down — connecting the headline cards directly to that ledger is the natural next iteration."*

None of this undermines the project — building the **structure** (the pages, the model, the 322 measures that ARE fully dynamic, the RLS, the automation) is the real, substantial work. Simplifying a few KPIs with placeholders while other data was still being integrated is a completely standard, honest engineering decision — just be ready to say so plainly rather than implying every number is a live calculation.

6. INTERVIEW QUESTION BANK

Technical / Deep-Dive

Q: How many tables and measures does your model actually have?

A: 29 tables, 322 measures, 73 calculated columns, and 26 calculated tables — my resume says “30+ measures” referring to the core, headline measures; the full model has grown well beyond that as the dashboard expanded.

Q: Why does your model only have one explicit relationship?

A: Most of my analytical logic runs directly on the core fact tables (Trenzy Sales Data, Order Data, Builder Leads Data); the other tables are lightweight, disconnected helper tables that drive specific visual formatting rather than being joined dimension tables.

Q: Talk me through a measure that uses variables (VAR).

A: Target Achievement % is a good example — VAR _rev = [Total Revenue Cr], VAR _target = [Target (₹ Cr)], then RETURN DIVIDE(_rev, _target, 0). Variables make multi-step DAX easier to read and debug than nesting everything in one expression.

Q: How does your anomaly detection work mathematically?

A: It calculates the mean and standard deviation of monthly revenue, then flags any month whose value falls outside a calculated band around that mean — a standard statistical outlier-detection approach.

Project-Specific

Q: What was the hardest part of building this?

A: Deciding how to handle a few KPIs where I didn't yet have full underlying data — like delivery dates for cycle time, or full cost allocation for margin by executive. I chose to model those with reasonable placeholder estimates rather than leave the card blank, while keeping a clear path to replace them with real calculations later.

Q: If you had another month, what would you fix first?

A: Replace the three hardcoded proxy measures — On-Time Delivery %, Cycle Time, and the receivables percentage-of-revenue calculations — with calculations built on the real underlying date and ledger data that already exists in the model.

Q: Who actually uses this dashboard day to day?

A: Sales leadership and executives across divisions — it replaced manual, delayed Excel reporting with a live, self-service view, so decisions on follow-ups, targets, and collections could be made same-day.

Behavioral (STAR)

Q: Tell me about a time your analysis changed a business decision.

A: **Situation** — leads were being lost with no clear cause. **Task** — figure out why conversion was inconsistent. **Action** — built the response-time bucket analysis. **Result** — found faster responses convert nearly double, reshaping follow-up prioritization.

Q: Tell me about a time you had to make a judgment call with incomplete data.

A: Use the honest-simplifications story directly — deciding to model on-time-delivery and margin with reasonable estimates rather than blocking the whole page on missing data, while flagging clearly (to yourself and stakeholders) that those were placeholders to revisit.

7. FINAL CHECKLIST

- Can explain all 10 dashboard pages without looking at notes.
- Know the 30-second, 2-minute, and 5-minute versions of the story.
- Comfortable with at least 5 real DAX formulas, not just the concept of DAX.
- Have an honest, calm answer ready for each of the 4 simplified/hardcoded measures.
- Know why the model has only 1 explicit relationship.
- Have the Trenzy_DAX_Reference.md file accessible in case anyone asks to see the raw model.
